

# Network Monitoring and Management

# Introduction to Networking Monitoring and Management

### **Part I: Overview**

### **Core concepts presented:**

- What is network monitoring?
- What is network management?
- Why do we need network management?
- The "big three" objectives
- Documentation
- Consolidating the data
- The big picture

# **Network Monitoring**

#### We Monitor systems and services to

- Measure availability and performance
  - Available, reachable
  - Round-trip-time, throughput
- Measure trends vs. resource limits
  - Expansion planning, maintain availability
- Collect statistics
  - For accounting and metering
- Detect issues
  - Failures, and/or attack/intrusion detection
  - Troubleshooting issues and tracking their history
- Detect changes to infrastructure and configurations
  - Documentation, revision control, logging

## **Expectations**

# A production network needs to be monitored in order to deliver on projected Service Level Agreements (SLAs)

- SLAs depend on policy
  - What does your management expect?
  - What do your users expect?
  - → What do your customers expect?
  - What does the rest of the Internet expect?
- What's good enough? 99.999% Uptime?
  - $\rightarrow$  There's no such thing as 100% uptime (as we'll see)  $\rightarrow$

## "Uptime" Expectations

#### What does it take to deliver 99.9 % uptime?

30.5 days x 24 hours = 732 hours a month

 $(732-(732 \times .999)) \times 60 = 44 \text{ minutes}$  only 44 minutes of downtime a month!

#### Need to shutdown 1 hour / week?

(732 - 4) / 732x 100 = 99.4 %

Remember to take planned maintenance into account in your calculations, and inform your users/customers if they are included/excluded in the SLA

### **How is availability measured?**

In the core? End-to-end? From the Internet?

# Baselining

## What is normal for your network?

To answer the question, you will need to know things like:

- Typical load on links(→ Cacti)
- Level of jitter between endpoints (→ Smokeping)
- Typical percent usage of resources
- Typical amounts of "noise":
  - Network scans
  - Dropped data
  - Reported errors or failures

# Why network management?

#### Know when to upgrade

Is your bandwidth usage too high? Where is your traffic going?

Do you need to get a faster line, or more providers? Is the equipment too old?

#### Keep an audit trace of changes

Record all changes, makes it easier to find cause of problems due to upgrades and configuration changes

#### Keep a history of your network operations

A ticket system lets you keep a history of events, allows you to back up your assertions with data

#### Accounting

Track usage of resources, invoice customers according to usage

#### **Know when you have problems**

Detect problems before your customers do

Monitoring software can generate tickets and notify staff of issues

#### **Trends**

All of this information can be used to view trends across your network, establish baseline, plan for future capacity, and detect anomalies such as network attacks

# The "Big Three" objectives

## **Availability**

Nagios Services, servers, routers, switches

## Reliability

Smokeping Connection health, rtt, service response time, latency

#### **Performance**

Cacti
 Total traffic, port usage, CPU
 RAM, Disk, processes

Functional overlap exists between these programs!

## **Attack Detection**

 Trends monitoring and automation help determine whether the network is under attack

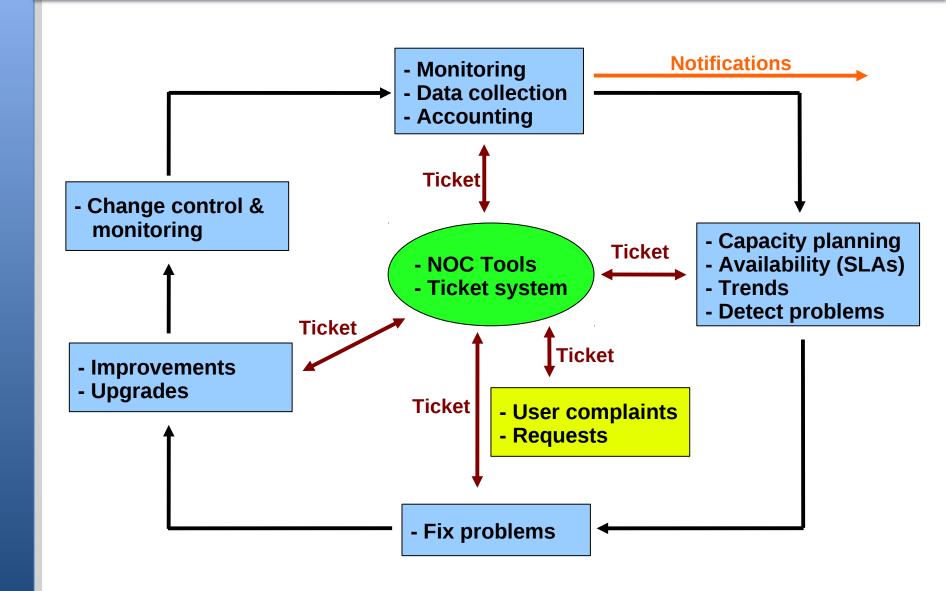

- The tools in use provide data that help you take steps to mitigate attacks:
  - Flows across network interfaces
  - Load on specific servers and/or services
  - Multiple service failures

## Consolidating the data

# The Network Operations Center (NOC) Where it all happens

- Coordination of tasks
- Status of network and services
- Fielding of network-related incidents and complaints
- Where the tools reside (NOC servers)
- Documentation including:
  - → Network diagrams
  - database/flat file of each port on each switch
  - → Network description
  - → Much more as you'll see

# The big picture

## A few Open Source solutions...

#### **Performance**

- Cricket
- IFPFM
- flowc
- mrtg\*
- NetFlow\*
- NfSen\*
- ntop
- perfSONAR
- pmacct
- RRDtool\*
- SmokePing\*

#### **Ticketing**

- RT\*
- Trac\*
- Redmine

#### **Change Mgmt**

- Mercurial
- Rancid\* (routers)
- CVS\*
- Subversion\*
- git\*

#### Security/NIDS

- Nessus
- OSSEC
- Prelude
- Samhain
- SNORT
- Untangle

#### Logging

- swatch\*
- syslog-ng/rsyslog\*
- tenshi\*

#### **Net Management**

- Big Brother
- Cacti\*
- Hyperic
- Munin
- Nagios\*
- OpenNMS\*
- Observium\*
- Sysmon
- Zabbix

#### **Documentation**

- IPplan
- Netdisco
- Netdot\*
- Rack Table

#### **Protocols/Utilities**

SNMP\*, Perl, ping

# **Questions?**

## **Part II: Details**

### Some details on the core concepts:

- Network documentation continued
- Diagnostic tools
- Monitoring tools
- Performance tools
- Active and passive tools
- SNMP
- Ticket systems
- Configuration and change management

# **Questions?**

### **Part III: Details**

## Some details on the core concepts:

- Diagnostic tools
- Monitoring tools
- Performance tools
- Active and passive tools
- SNMP
- Ticket systems
- Configuration and change management

### **Three kinds of tools**

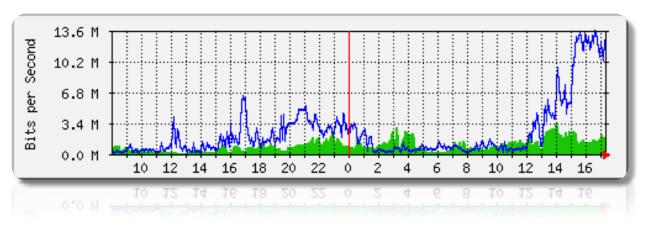

- Diagnostic tools used to test connectivity, ascertain that a location is reachable, or a device is up – usually active tools
- 2. Monitoring tools tools running in the background ("daemons" or services), which collect events, but can also initiate their own probes (using diagnostic tools), and recording the output, in a scheduled fashion.

#### 1. Performance Tools

Key is to look at each router interface (probably don't need to look at switch ports).

#### Two common tools:

- Netflow/NfSen: http://nfsen.sourceforge.net/
- MRTG: http://oss.oetiker.ch/mrtg/

MRTG = "Multi Router Traffic Grapher"

#### **Active tools**

- Ping test connectivity to a host
- Traceroute show path to a host
- MTR combination of ping + traceroute
- SNMP collectors (polling)

#### **Passive tools**

- log monitoring, SNMP trap receivers, NetFlow

#### **Automated tools**

- SmokePing record and graph latency to a set of hosts, using ICMP (Ping) or other protocols
- MRTG/RRD record and graph bandwidth usage on a switch port or network link, at regular intervals

### **Network & Service Monitoring tools**

- Nagios server and service monitor
  - → Can monitor pretty much anything
  - → HTTP, SMTP, DNS, Disk space, CPU usage, ...
  - → Easy to write new plugins (extensions)
- Basic scripting skills are required to develop simple monitoring jobs – Perl, Shell scripts, php, etc...
- Many good Open Source tools
  - → Zabbix, ZenOSS, Hyperic, OpenNMS ...

# Use them to monitor reachability and latency in your network

- Parent-child dependency mechanisms are very useful!

## **Monitor your critical Network Services**

- DNS/Web/Email
- Radius/LDAP/SQL
- SSH to routers

# How will you be notified? Don't forget log management!

- Every network device (and UNIX and Windows servers as well) can report system events using syslog
- You MUST collect and monitor your logs!
- Not doing so is one of the most common mistakes when doing network monitoring

## Network management protocols

# SNMP – Simple Network Management Protocol

- Industry standard, hundreds of tools exist to exploit it
- Present on any decent network equipment
  - → Network throughput, errors, CPU load, temperature, ...
- UNIX and Windows implement this as well
  - → Disk space, running processes, ...

#### SSH and telnet

 It is also possible to use scripting to automate monitoring of hosts and services

### **SNMP tools**

#### **Net SNMP tool set**

http://net-snmp.sourceforge.net/

#### Very simple to build simple tools

- One that builds snapshots of which IP is used by which Ethernet address
- Another that builds shapshots of which Ethernet addresses exist on which port on which switch.
- Query remote RAID array for state.
- Query server, switches and routers for temperatures.
- Etc...

## Statistics and accounting tools

## Traffic accounting and analysis

- What is your network used for, and how much
- Useful for Quality of Service, detecting abuses, and billing (metering)
- Dedicated protocol: NetFlow
- Identify traffic "flows": protocol, source, destination, bytes
- Different tools exist to process the information
  - → Flowtools, flowc
  - → NFSen
  - → Many more: http://www.networkuptime.com/tools/netflow/

# Fault and problem management

### Is the problem transient?

- Overload, temporary resource shortage

## Is the problem permanent?

- Equipment failure, link down

### How do you detect an error?

- Monitoring!
- Customer complaints

## A ticket system is essential

- Open ticket to track an event (planned or failure)
- Define dispatch/escalation rules
  - → Who handles the problem?
  - → Who gets it next if no one is available?

# **Ticketing systems**

### Why are they important?

- Track all events, failures and issues

# Focal point for helpdesk communication Use it to track all communications

Both internal and external

### **Events originating from the outside:**

customer complaints

## **Events originating from the inside:**

- System outages (direct or indirect)
- Planned maintenances or upgrades Remember to notify your customers!

# **Ticketing systems**

- Use ticket system to follow each case, including internal communication between technicians
- Each case is assigned a case number
- Each case goes through a similar life cycle:
  - New
  - Open
  - **–** ...
  - Resolved
  - Closed

## **Ticketing systems**

#### Workflow:

## Ticketing systems: examples

## rt (request tracker)

- Heavily used worldwide.
- A classic ticketing system that can be customized to your location.
- Somewhat difficult to install and configure.
- Handles large-scale operations.

#### trac

- A hybrid system that includes a wiki and project management features.
- Ticketing system is not as robust as rt, but works well.
- Often used for "trac"king group projects.

#### redmine

Like trac, but more robust. Harder to install

# Network Intrusion Detection Systems (NIDS)

These are systems that observe all of your network traffic and report when it sees specific kinds of problems, such as:

hosts that are infected or are acting as spamming sources.

#### A few tools:

- SNORT a commonly used open source tool: http://www.snort.org/
- Prelude Security Information Management System https://dev.prelude-technologies.com/
- Samhain Centralized HIDS http://la-samhna.de/samhain/
- Nessus scan for vulnerabilities: http://www.nessus.org/download/

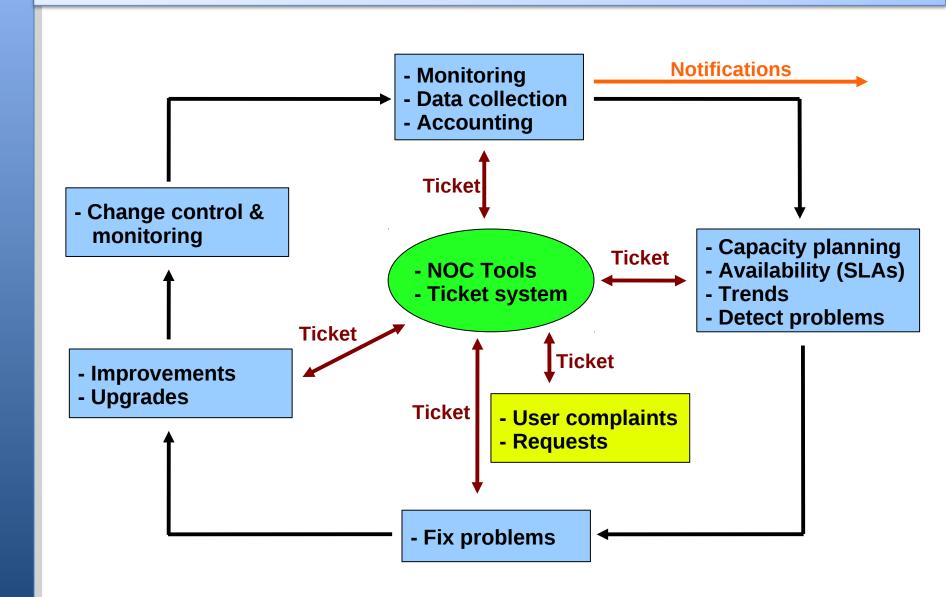

# **Configuration mgmt & monitoring**

- Record changes to equipment configuration using
  - revision control (also for configuration files)
- Inventory management (equipment, IPs, interfaces)
- Use versioning control
  - As simple as:
    - "cp named.conf named.conf.20070827-01"
- For plain configuration files:
  - CVS, Subversion (SVN)
  - Mercurial
- For routers:
  - RANCID

# **Configuration mgmt & monitoring**

- Traditionally, used for source code (programs)
- Works well for any text-based configuration files
  - Also for binary files, but less easy to see differences
- For network equipment:
  - RANCID (Automatic Cisco configuration retrieval and archiving, also for other equipment types)
- Built-in to Project Management Software like:
  - Trac
  - Redmine
  - And, many other wiki products. Excellent for documenting your network.

# The big picture revisited

# **Questions**
