

Step Zero

Clean up your desks! :)

Goals of this Lab

- Learn how the programming takes place
- Exercises about:
 - installing the IDE
 - setting the clock
 - measuring the temperature
 - timestamping the temperature reading

Installing the IDE

- IDE= Integrated development environment
- Arduino IDE is Open Source

Download the Arduino IDE (Integrated Development Environment)

Access the Internet

In order to get your Arduino up and running, you'll need to download some software first from www.arduino.cc (it's free!). This software, known as the Arduino IDE, will allow you to program the Arduino to do exactly what you want. It's like a word processor for writing programs. With an internet-capable computer, open up your favorite browser and type in the following URL into the address bar:

< case sensitive >

Installing the IDE

Windows Installation Process

Go to the web address below to access the instructions for installations on a Windows-based computer.

[*http://arduino.cc/en/Guide/Windows*](http://arduino.cc/en/Guide/Windows)

Macintosh OS X Installation Process

Macs do not require you to install drivers. Enter the following URL if you have questions. Otherwise proceed to next page.

[*http://arduino.cc/en/Guide/MacOSX*](http://arduino.cc/en/Guide/MacOSX)

Linux: 32 bit / 64 bit, Installation Process

Go to the web address below to access the instructions for installations on a Linux-based computer.

[*http://www.arduino.cc/playground/Learning/Linux*](http://www.arduino.cc/playground/Learning/Linux)

Connect your Arduino

// Connect your Arduino Uno to your Computer

Use the USB cable provided in the SIK kit to connect the Arduino to one of your computer's USB inputs.

2

Note: we will use a slightly different board, which you connect through one additional small board, the programmer

Connect your Seeduino

This is the USB-to-serial adapter - it will be between your computer and the Seeduino board

Connect the multi-colored cable so that the GND pins on the Seeduino and on the USB device have the same color (white, for example).

Connect your Seeduino

The other end of this USB cable goes to your computer.

Open Arduino IDE

- Using the workshop's laptops:
 - Open the terminal
 - Write: `sudo ./arduino-1.0.6/arduino`
 - Root password is `wsn@2014`
- The source code will appear in the IDE window.

The Arduino IDE

The screenshot shows the Arduino IDE interface. The title bar reads "arashi_eth_bridge | Arduino 1.0.3". The menu bar includes "File", "Edit", "Tools", and "Window". The toolbar contains icons for opening, saving, and uploading. The main editor window displays the sketch "arashi_eth_bridge.h" with the following code:

```
// Connection:
// * An Arduino Ethernet Shield
// * D3: The output pin of the Geiger counter (active low)
//
// Requirements:
// EthernetDHCP
// http://gkaindl.com/software/arduino-ethernet
//
// Reference:
// * http://www.sparkfun.com/products/9848

#include <SPI.h>
#include <Ethernet.h>
#include <avr/eeprom.h>
#include <chibi.h>
#include <limits.h>
#include <avr/wdt.h>
#include <stdint.h>
#include "arashi_eth_bridge.h"
#include "src/chb_drvr.h"

#define DEBUG 0

#if (DEBUG == 0)
  #define PRINT(x) client.print(x)
  #define PRINTLN(x) client.println(x)
#else
  #define PRINT(x) Serial.print(x)
  #define PRINTLN(x) Serial.println(x)
#endif
#endif
```

Below the editor, a status bar indicates "Done uploading." and "Binary sketch size: 27,768 bytes (of a 30,720 byte maximum)". The bottom status bar shows "424" and "Arduino Pro or Pro Mini (3.3V, 8 MHz) w/ ATmega328 on /dev/cu.usbserial-A6015YND".

1: Select serial port

Select the Serial Port:
tty/USBx on Linux,
COMx on Windows

2: Select Arduino model

Select Board:
Arduino Pro
3.3V, ATmega328

Programming an Arduino

From the File menu, choose Open and select the code you want to open.

The source code will appear in the IDE window.

Lab Examples

From the Workshop's webpage,
download the zip file with all the examples
for this Lab 1 Session.

Open the folder called Example_1
and open the Example_1.ino file

Programming workflow

1. Opening

2. Verifying

3. Uploading

Open

Verify

Upload

Programming an Arduino

Click on the upload button and wait until the code has been compiled and uploaded.

At the end you will see in the bottom right corner:

Done uploading.

Programming an Arduino

This is the template of a basic Arduino program:

```
void setup()  
{  
  Initialize variables, open USB, open WiFi, etc  
}
```

SETUP
(once)

```
void loop()  
{  
  Perform some action  
  
  Wait for a certain number of msecs or wait for an alarm  
}
```

LOOP
(forever)

Lab session

This lab session will be like this:

```
For (i=1;i<=3;i++) {  
    Simple example (me) /* 2 min */  
    Extended example (you) /* 20 min */  
}
```

Real-world exercise /* 1 hour */

Start!

Example_1

Example_1 will blink a light (Hello World! in the WSN world) on the Seeduino.

```
int led = 13;

void setup() {
  // initialize the digital pin as an output.
  pinMode(led, OUTPUT);
}

// the loop routine runs over and over again forever:
void loop() {
  digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)
  delay(1000);             // wait for a second
  digitalWrite(led, LOW);  // turn the LED off by making the voltage LOW
  delay(1000);             // wait for a second
}
```

Example_1 output

Example_1 - extended

Get acquainted with the IDE

Make the LED blink for a different amount of time

Make the LED blink as fast as possible!

If you would like more light, stick an LED into pin 13 (long LED wire) and ground (short LED wire) :)

Seeeduino

Seeeduino is an Arduino board designed for WSN applications.

Special features:

- RTC (Real Time Clock) to timestamp the data
- microSD card to store data
- socket for Xbee modules
- solar charger on board
- very low deep sleep mode (1000uA)

Seeeduino

Seeeduino RTC

Having a RTC is useful for two reasons:

1. to time stamp the collected data (for example: temperature is 27.4C at 10:02:30 of 6/7/2020)
2. to be able to set alarms to wake up the mote from sleeping mode (for example: wake up on Tuesday 15th of August at 10:30:00).

Insert the coin battery in the Seeeduino.

The + on the battery should face upwards.

Example_2

Example_2 will set the time of the Seeduino using the RTC.

To program the RTC you need to download some libraries first. In the zip file you will find the DS3231 library and examples.

Place the files in folder labelled “ds3231_library” into your Arduino libraries folder.

Linux: /home/wsn/arduino-1.0.6/libraries

Windows: .../documents/arduino/libraries

Restart the IDE!

Example_2

Example_2 will set the time of the Seeduino using the RTC.

Change the line:

```
DateTime dt(2011, 11, 10, 15, 18, 0, 5);
```

to adjust to today's date and time.

Format is: year, month, date, hour, min, sec and week-day (starts from 0 (Sunday) and goes to 6 (Saturday))

Example_2

How do you see the output of your code?

You need to check the output coming from the USB port.

Select Serial Monitor:

Note the Serial Baud Rate that is set in the code!
Your Serial Monitor needs to match that!

Example_2 output

A terminal window with a title bar containing three colored buttons (red, yellow, green) and the text `/dev/tty.usbserial-A1017IVV`. The terminal displays a series of timestamped log entries. Each entry consists of a date and time followed by the word "Sat". The timestamps range from 2013/3/16 11:28:0 to 2013/3/16 11:28:7. There is a duplicate entry for 11:28:0.

```
2013/3/16 11:28:0
Sat
2013/3/16 11:28:1
Sat
2013/3/16 11:28:2
Sat
2013/3/16 11:28:3
Sat
2013/3/16 11:28:4
Sat
20132013/3/16 11:28:0
Sat
2013/3/16 11:28:1
Sat
2013/3/16 11:28:2
Sat
2013/3/16 11:28:3
Sat
2013/3/16 11:28:4
Sat
2013/3/16 11:28:5
Sat
2013/3/16 11:28:6
Sat
2013/3/16 11:28:7
```

Example_2 - extended

Comment the line where you set the time. Is the time OK?

Disconnect the Seeduino from the USB. Connect it again. Are the dats and time OK?

Example_3

The RTC has a temperature sensor to keep the clock calibrated.

```
void setup ()
{
  Serial.begin(57600);
  Wire.begin();
  RTC.begin();
}
void loop ()
{
  RTC.convertTemperature();
  Serial.print(RTC.getTemperature());
  Serial.println("deg C");
  delay(1000);
}
```

Example_3 output

```
23.50deg C
23.50deg C
23.50deg C
23.50deg C
23.50deg C
23.50deg C
23.50deg C
23.50deg C
```

Example_3 - extended

Put the Seeduino near the window / light: does the temperature change?

Convert the temperature to Fahrenheit and show values in both C and F.

Exercise

I own a chalet in Switzerland and want to monitor its temperature every 2 minutes. I want to visualize date, time and temperature.

Seeeduino Grove

The Grove system is a modular, safe and easy to use group of items that allow you to minimise the effort required to get started with microcontroller-based experimentation and learning.

Seeeduino Grove

Seeeduino Grove base shield

Seeeduino Grove base shield

Seeeduino Grove units: button

Seeeduino Grove units: LED

Seeeduino Grove units: Temperature

Seeeduino Grove units

Exercise

Feel free to take as many Grove units as you want and experiment with them!

Thanks

Marco Zennaro
