Why Shell Scripting?

- Scheduled Tasks
- Repetitive sequences
- Boot scripts

When Not To Use Shell Scripting

- Resource-intensive tasks, especially where speed is a factor
- Complex applications, where structured programming is a necessity
- Need direct access to system hardware
- Proprietary, closed-source applications

Sample Repetitive Tasks

- Cleanup
- Run as root, of course.
- **Do not run these: demo only!**

```
# cd /var/log
# cat /dev/null > messages
# cat /dev/null > wtmp
# echo "Logs cleaned up."
```

- You can put these commands in a file and run **bash filename**

Hash Bang

- `#!` and the shell (first line only)
- **`chmod a+x`** (remember the permissions)
- Example: put the following text in `hello.sh`

```
#!/bin/sh  
  
echo Hello World
```

`$ chmod a+x hello.sh`

`$ ./hello.sh` (remember `$PATH`)

Variables

- Variable is a “container” of data. Some variables already exist in your “environment” like \$PATH and \$PROMPT
- Shell substitutes any token that starts with \$ with the contents of the variable of that name
- Variable can be created using VAR=something – some shells require the keyword “set” to make it persist, others need “export”

Sample Special Variables

```
$ echo $PATH
```

shell searches PATH for programs if you do not type them with an absolute path

```
$ echo pwd
```

```
$ echo $( pwd )
```

shell runs command in between “\$(“ and “)” and prints to the command line

```
$ echo $?
```

When a process ends, it can leave an integer “exit code”. If the exit code is zero then usually it exited successfully. Non zero usually indicates an error.

Sample Repetitive Tasks

```
#!/bin/bash # Proper header for a Bash script.

# Cleanup, version 2
# Run as root, of course.
# Insert code here to print error message and exit if not
  root.

LOG_DIR=/var/log # Variables are better than hard-coded
  values.

cd $LOG_DIR
cat /dev/null > messages
cat /dev/null > wtmp

echo "Logs cleaned up."

exit # The right and proper method of "exiting" from a script.
```

Conditionals

*if expression **then** statement*

*if expression **then** statement1 **else** statement2.*

*if expression1 **then** statement1 **else if** expression2
then statement2 **else** statement3*

Bash Conditional Syntax

```
#!/bin/bash
if [ "foo" = "foo" ]; then
    echo expression evaluated as true
fi
```

```
#!/bin/bash
if [ "foo" = "foo" ]; then
    echo expression evaluated as true
else
    echo expression evaluated as false
fi
```

Loops

- **for** loop lets you iterate over a series of 'words' within a string.
- **while** executes a piece of code if the control expression is true, and only stops when it is false
- **until** loop is almost equal to the while loop, except that the code is executed while the control expression evaluates to false.

Sample Syntax

```
#!/bin/bash
for i in $( ls ); do
    echo item: $i
done
```

```
#!/bin/bash
COUNTER=0
while [ $COUNTER -lt 10 ]; do
    echo The counter is $COUNTER
    let COUNTER=COUNTER+1
done
```

```
#!/bin/bash
COUNTER=20
until [ $COUNTER -lt 10 ]; do
    echo COUNTER $COUNTER
    let COUNTER-=1
done
```

Practice

Write a shell script to print the disk usage every 5 seconds.

Hint: **sleep *N*** is a command which will basically put the prompt/program to sleep for *N* seconds

Hint2: in any conditional, you can say “**true**” or “**false**” to force it to always evaluate like that.

Extras

Programming (say in C) builds on similar concepts.

Source text is COMPILED into binary machine code. Why?

Hello World, c style

Edit hello.c and put the following text

```
#include <stdio.h>
int main(){
    printf("Hello World\n");
    return 0;
}
```

Type **gcc -o hello hello.c**

Type **./hello ; echo \$?**

Change the return 0 to return 42

Compile it again,

Run **./hello; echo \$?**
