

Network Monitoring & Management: Nagios

Network Startup Resource Center
www.nsrc.org

These materials are licensed under the Creative Commons Attribution-NonCommercial 4.0 International license (<http://creativecommons.org/licenses/by-nc/4.0/>)

Introduction

- Possibly the most used open source network monitoring software
- Web interface for viewing status, browsing history, scheduling downtime etc
- Sends out alerts via E-mail. Can be configured to use other mechanisms, e.g. SMS

Introduction

Nagios actively monitors the **availability**

- of Hosts (devices)
- and Services

NS1-TLD5	SSH	OK	2009-09-03 14:42:06	1d 22h 41m 20s	1/4	SSH OK - OpenSSH_5.1p1 Debian-3ubuntu1 (protocol 2.0)
NS1-TLD6	SSH	OK	2009-09-03 14:44:43	1d 22h 43m 43s	1/4	SSH OK - OpenSSH_5.1p1 Debian-3ubuntu1 (protocol 2.0)

Features

Utilizes topology to determine dependencies.

- Differentiates between what is *down* vs. what is *unreachable*. Avoids running unnecessary checks and sending redundant alarms

Allows you to define how to send notifications based on combinations of:

- Contacts and lists of contacts
- Devices and groups of devices
- Services and groups of services
- Defined hours by persons or groups.
- The state of a service.

Plugins

Plugins are used to verify services and devices:

- Nagios architecture is simple enough that writing new plugins is fairly easy in the language of your choice.
- There are **many, many** plugins available (thousands).
 - ✓ <http://exchange.nagios.org/>
 - ✓ <http://nagiosplugins.org/>

Pre-installed Plugins for Ubuntu

/usr/lib/nagios/plugins

```
nsrc@s1:~$ ls /usr/lib/nagios/plugins
check_apt      check_disk    check_hppjd   check_jabber  check_mysql   check_ntp_time  check_real    check_ssh     check_wave
check_breeze   check_disk_smb  check_http    check_ldap    check_mysql_query  check_nwstat    check_rpc     check_ssmtmp  negate
check_by_ssh   check_dns      check_icmp    check_ldaps   check_nagios   check_oracle    check_rta_multi  check_swap    urlize
check_clamd    check_dummy    check_ide_smart  check_load    check_nntp     check_overcr    check_sensors  check_tcp     utils.pm
check_cluster  check_file_age  check_ifoperstatus  check_log     check_nntpss   check_pgsql     check_simap    check_time    utils.sh
check_dbi      check_flexlm   check_ifstatus  check_mailq   check_nt       check_ping      check_smtp     check_udp
check_dhcp     check_ftp      check_imap    check_mrtg    check_ntp      check_pop       check_snmp     check_ups
check_dig      check_host     check_ircd    check_mrtgtraf  check_ntp_peer  check_procs     check_spop     check_users
```

/etc/nagios-plugins/config

```
nsrc@s1:~$ ls /etc/nagios-plugins/config/
apt.cfg      disk-smb.cfg  fping.cfg    http.cfg      mail.cfg      netware.cfg  postgresql.cfg  real.cfg      tcp_udp.cfg
breeze.cfg   dns.cfg       ftp.cfg      ifstatus.cfg  mailq.cfg     news.cfg     ping.cfg        rpc-nfs.cfg   telnet.cfg
dhcp.cfg     dummy.cfg     games.cfg    ldap.cfg      mrtg.cfg     nt.cfg       procs.cfg       snmp.cfg      users.cfg
disk.cfg     flexlm.cfg    hppjd.cfg   load.cfg      mysql.cfg     ntp.cfg      radius.cfg      ssh.cfg
```

How Checks Work

- Periodically Nagios calls a plugin to test the state of each service. Possible responses are:
 - OK
 - WARNING
 - CRITICAL
 - UNKNOWN
- If a service is not OK it goes into a “soft” error state. After a number of retries (default 3) it goes into a “hard” error state. At that point an alert is sent.
- You can also trigger external event handlers based on these state transitions

How Checks Work (Continued)

Parameters

- Normal checking interval
- Retry interval (i.e. when not OK)
- Maximum number of retries
- Time period for performing checks
- Time period for sending notifications

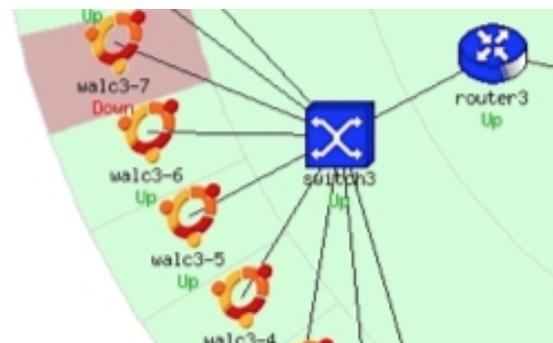

Scheduling

- Nagios spreads its checks throughout the time period to even out the workload
- Web UI shows when next check is scheduled

Hierarchy: The Concept of Parents

Hosts can have parents:

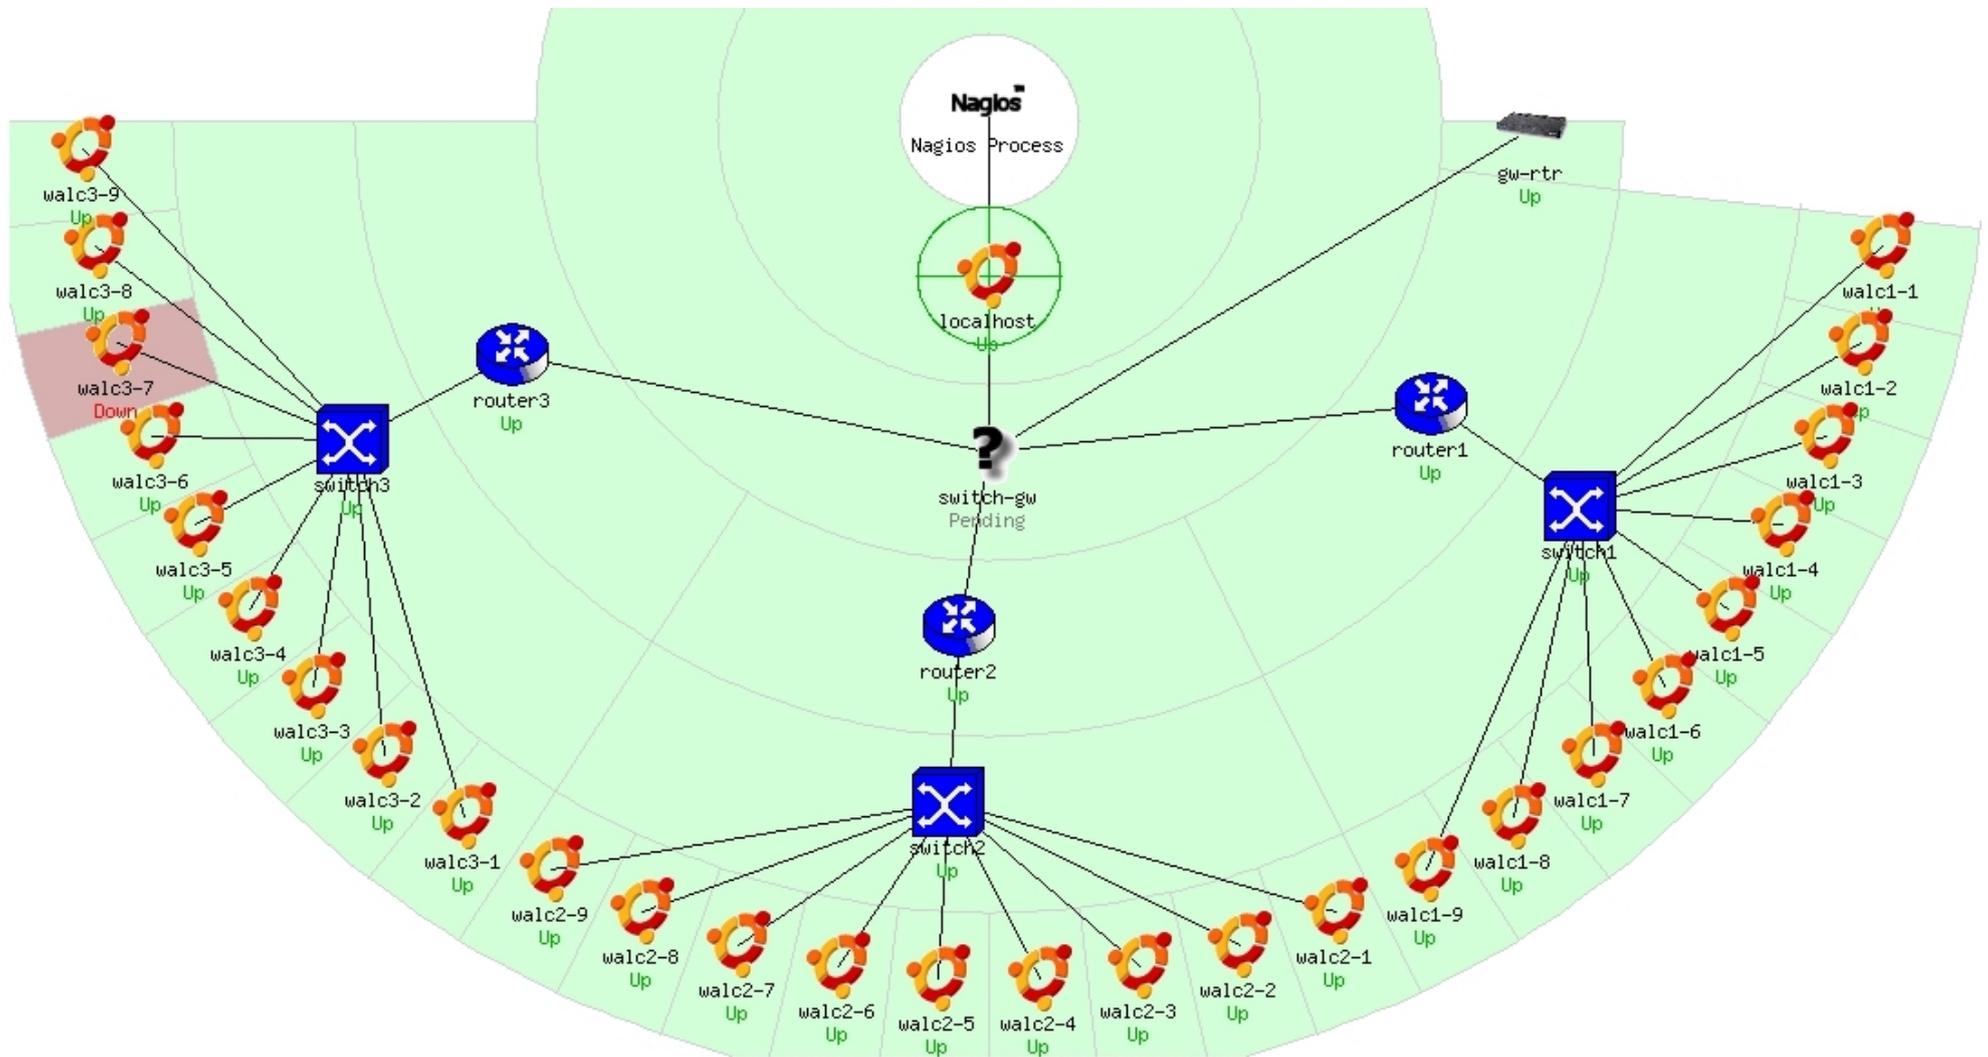

- The parent of a **PC** connected to a **switch** would be the **switch**.
- Allows us to specify the dependencies between devices.
- Avoids sending alarms when parent does not respond.
- A node can have multiple parents (dual homed).

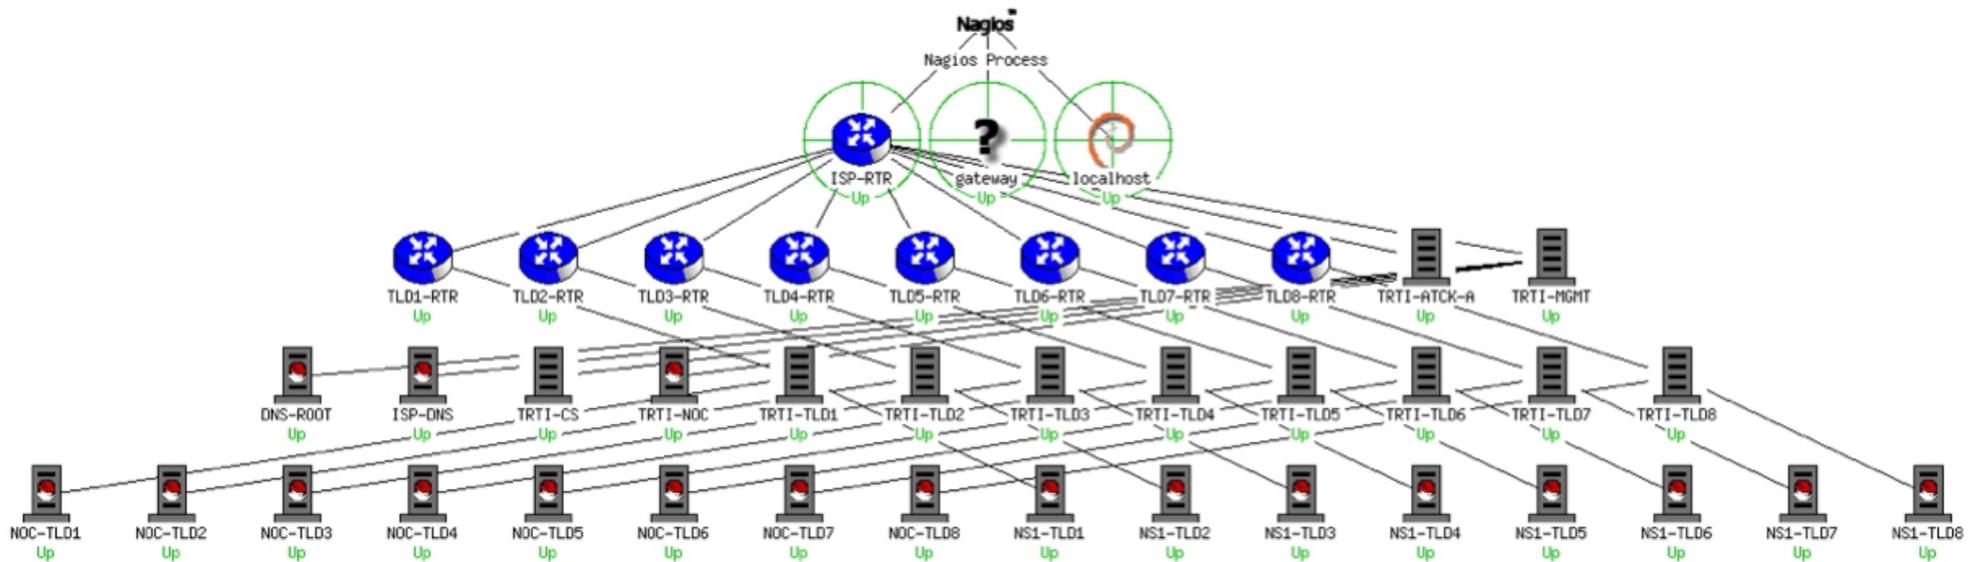

Network Viewpoint

- Where you locate your Nagios server will determine your point of view of the network.
- The Nagios server becomes the “root” of your dependency tree

Network Viewpoint

Collapsed Tree Network View

Demo of Nagios

<http://noc.ws.nsrc.org/nagios3/>

nagiosadmin: lab_password

Installation

In Debian/Ubuntu

```
# apt-get install nagios3
```

Key directories

```
/etc/nagios3
```

```
/etc/nagios3/conf.d
```

```
/etc/nagios-plugins/config
```

```
/usr/lib/nagios/plugins
```

```
/usr/share/nagios3/htdocs/images/logos
```

Nagios web interface is here:

<http://pcN.ws.nsrc.org/nagios3/>

Host and Services Configuration

Based on templates

- This saves lots of time avoiding repetition

There are default templates with default parameters for a:

- *generic host* (generic-host_nagios2.cfg)
- *generic service* (generic-service_nagios2.cfg)
- Individual settings can be overridden
- Defaults are all sensible

Configuration

- Configuration defined in text files
 - `/etc/nagios3/conf.d/*.cfg`
 - Details at http://nagios.sourceforge.net/docs/3_0/objectdefinitions.html
- The default config is broken into several files with different objects in different files, but actually you can organise it how you like
- Always verify before restarting Nagios – otherwise your monitoring system may die!
 - `nagios3 -v /etc/nagios3/nagios.cfg`

Monitoring a Single Host

pcs.cfg

```
define host {  
    host_name pc1  
    alias      pc1 in group 1  
    address    pc1.ws.nsrc.org  
    use        generic-host  
}
```

copy settings from this template

- This is a minimal working config
 - You are just pinging the host; Nagios will warn that you are not monitoring any services
- The filename can be anything ending **.cfg**
- Organise your devices however you like – e.g. related hosts in the same file

Generic Host Template

generic-host_nagios2.cfg

```
define host {
    name                generic-host      ; The name of this host template
    notifications_enabled 1 ; Host notifications are enabled
    event_handler_enabled 1 ; Host event handler is enabled
    flap_detection_enabled 1 ; Flap detection is enabled
    failure_prediction_enabled 1 ; Failure prediction is enabled
    process_perf_data     1 ; Process performance data
    retain_status_information 1 ; Retain status information across program restarts
    retain_nonstatus_information 1 ; Retain non-status information across restarts
    check_command         check-host-alive
    max_check_attempts    10
    notification_interval 0
    notification_period   24x7
    notification_options  d,u,r
    contact_groups        admins
    register              0 ; DON'T REGISTER THIS DEFINITION -
                          ; IT'S NOT A REAL HOST, JUST A TEMPLATE!
}
```

Overriding Defaults

All settings can be overridden per host

pcs.cfg

```
define host {  
    host_name          pc1  
    alias              pc1 in group 1  
    address            pc1.ws.nsrc.org  
    use                generic-host  
    notification_interval 120  
    contact_groups      admins,managers  
}
```

Defining Services: Direct Way

```
define host {  
  host_name      pc1  
  alias          pc1 in group 1  
  address        pc1.ws.nsrc.org  
  use            generic-host  
}
```

pcs.cfg

```
define service {  
  host_name          pc1  
  service_description HTTP  
  check_command      check_http  
  use                generic-service  
}
```

service "pc1,HTTP"

plug
in

```
define service {  
  host_name          pc1  
  service_description SSH  
  check_command      check_ssh  
  use                generic-service  
}
```

service
template

Service Checks

- The combination of host + service is a unique identifier for the service check, e.g.
 - “pc1,HTTP”
 - “pc1,SSH”
 - “pc2,HTTP”
 - “pc2,SSH”
- *check_command* points to the plugin
- *service template* pulls in settings for how often the check is done, and who and when to alert

Generic Service Templates

```
define service{
    name                                generic-service
    active_checks_enabled                1
    passive_checks_enabled              1
    parallelize_check                    1
    obsess_over_service                  1
    check_freshness                      0
    notifications_enabled                1
    event_handler_enabled                1
    flap_detection_enabled               1
    failure_prediction_enabled           1
    process_perf_data                    1
    retain_status_information             1
    retain_nonstatus_information         1
    notification_interval                0
    is_volatile                          0
    check_period                          24x7
    normal_check_interval                 5
    retry_check_interval                 1
    max_check_attempts                   4
    notification_period                  24x7
    notification_options                  w,u,c,r
    contact_groups                        admins
    register                              0 ; DONT REGISTER THIS DEFINITION
}
```

generic-service_nagios2.cfg

(comments have been removed)

Overriding Defaults

Again, settings can be overridden per service

services_nagios2.cfg

```
define service {  
    host_name          pc1  
    service_description HTTP  
    check_command      check_http  
    use                generic-service  
    contact_groups    admins,managers  
    max_check_attempts 3  
}
```

Repeating Service Checks

- Often we are monitoring an identical service on many hosts
- To avoid duplication, a better way is to define a service check for all hosts in a *hostgroup*

Creating Hostgroups

hostgroups_nagios2.cfg

```
define hostgroup {
    hostgroup_name    http-servers
    alias             HTTP servers
    members         pc1,pc2
}

define hostgroup {
    hostgroup_name    ssh-servers
    alias             SSH servers
    members         pc1,pc2
}
```

Monitoring Services in Hostgroups

```
define service {
    hostgroup_name      http-servers
    service_description  HTTP
    check_command        check_http
    use                  generic-service
}

define service {
    hostgroup_name      ssh-servers
    service_description  SSH
    check_command        check_ssh
    use                  generic-service
}
```

services_nagios2.cfg

if hostgroup "http-servers" contains pc1 & pc2 then Nagios creates HTTP service checks for both hosts. The service checks are called "pc1,HTTP" and "pc2,HTTP"

Alternative View

- “this hostgroup contains these PCs”

or:

- “this PC belongs to these hostgroups”
- No need for “members” line in hostgroups file

Alternative Group Membership

```
define host {  
    host_name      pc1 pcs.cfg  
    alias          pc1 in group 1  
    address        pc1.ws.nsrc.org  
    use            generic-host  
    hostgroups   ssh-servers,http-servers  
}  
  
define host {  
    host_name      pc2  
    alias          pc2 in group 1  
    address        pc2.ws.nsrc.org  
    use            generic-host  
    hostgroups   ssh-servers,http-servers  
}
```

Hosts and services conveniently defined in the same place

Other Uses for Hostgroups

Choosing icons for the status map

```
define host {
    host_name      pc1
    alias          pc1 in group 1
    address        pc1.ws.nsrc.org
    use            generic-host
    hostgroups     ssh-servers,http-servers,debian-servers
}

```

pcs.cfg

```
define hostextinfo {
    hostgroup_name    debian-servers
    notes              Debian GNU/Linux servers
    icon_image         base/debian.png
    statusmap_image    base/debian.gd2
}

```

extinfo_nagios2.cfg

Optional: Servicegroups

- Services can be grouped into a “servicegroup”
- This is so related or dependent services can be viewed together in the web interface
- The services themselves must already exist

```
define servicegroup {
    servicegroup_name    mail-services
    alias                 Services comprising the mail platform
    members               web1,HTTP,web2,HTTP,mail1,IMAP,db1,MYSQL
}
```

servicegroups.cfg

Configuring Topology

```
define host {  
  host_name      pc1  
  alias          pc1 in group 1  
  address        pc1.ws.nsrc.org  
  use            generic-host  
  parents        rtr1  
}
```

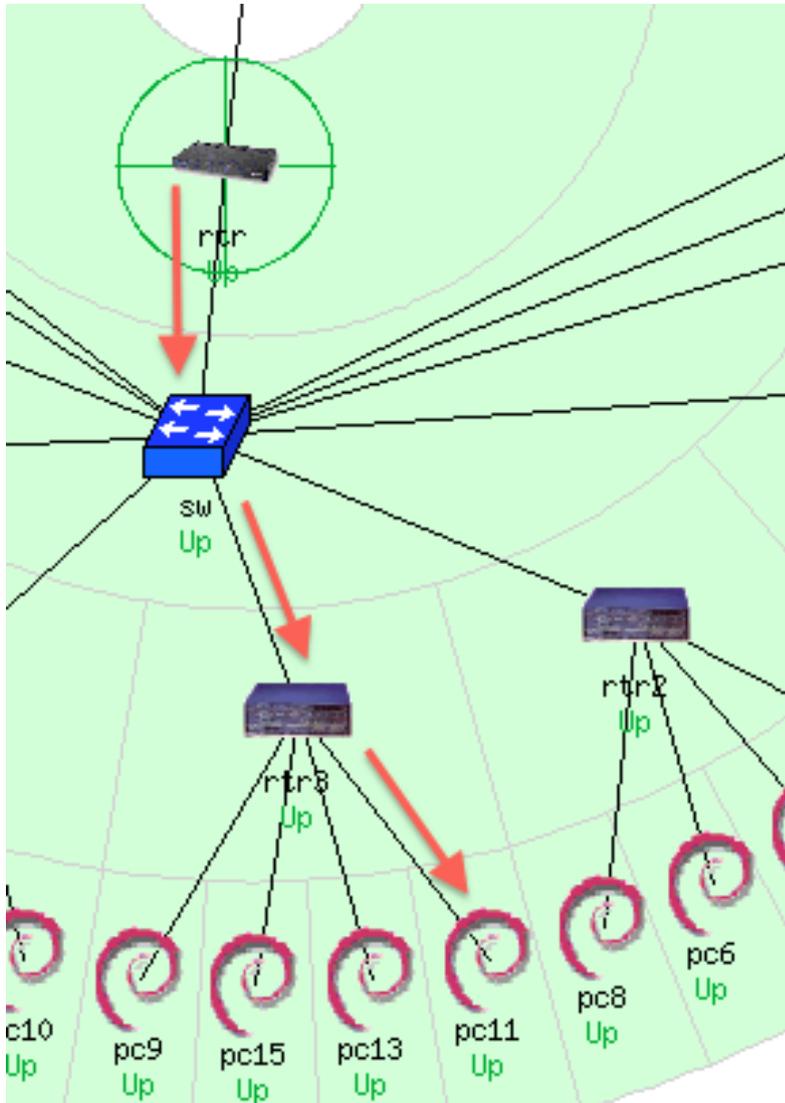

pcs.cfg

parent
host

- This means “pc1 is on the far side of rtr1”
- If rtr1 goes down, pc1 is “unreachable”, not “down”
- Prevents a cascade of alerts if rtr1 goes down
- Also allows Nagios to draw cool status map

Another View of Configuration

RTR

```
define host {  
    use generic-host  
    host_name rtr  
    alias Gateway Router  
    address 10.10.0.254 }
```

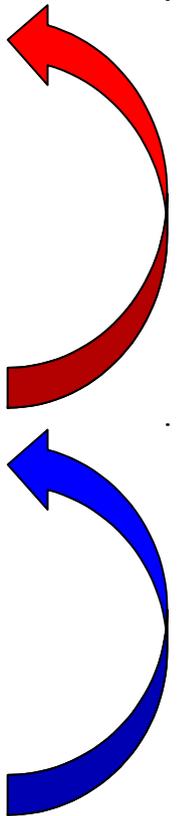

SW

```
define host {  
    use generic-host  
    host_name sw  
    alias Backbone Switch  
    address 10.10.0.253  
    parents rtr }
```

RTR3

```
define host {  
    use generic-host  
    host_name rtr3  
    alias router 3  
    address 10.10.3.254  
    parents sw }
```

PC11...

Out of Band (OOB) Notifications

A critical item to remember: an SMS or message system that is independent from your network.

- You can utilize a cell phone connected to the Nagios server, or a USB dongle with SIM card
- You can use packages like:

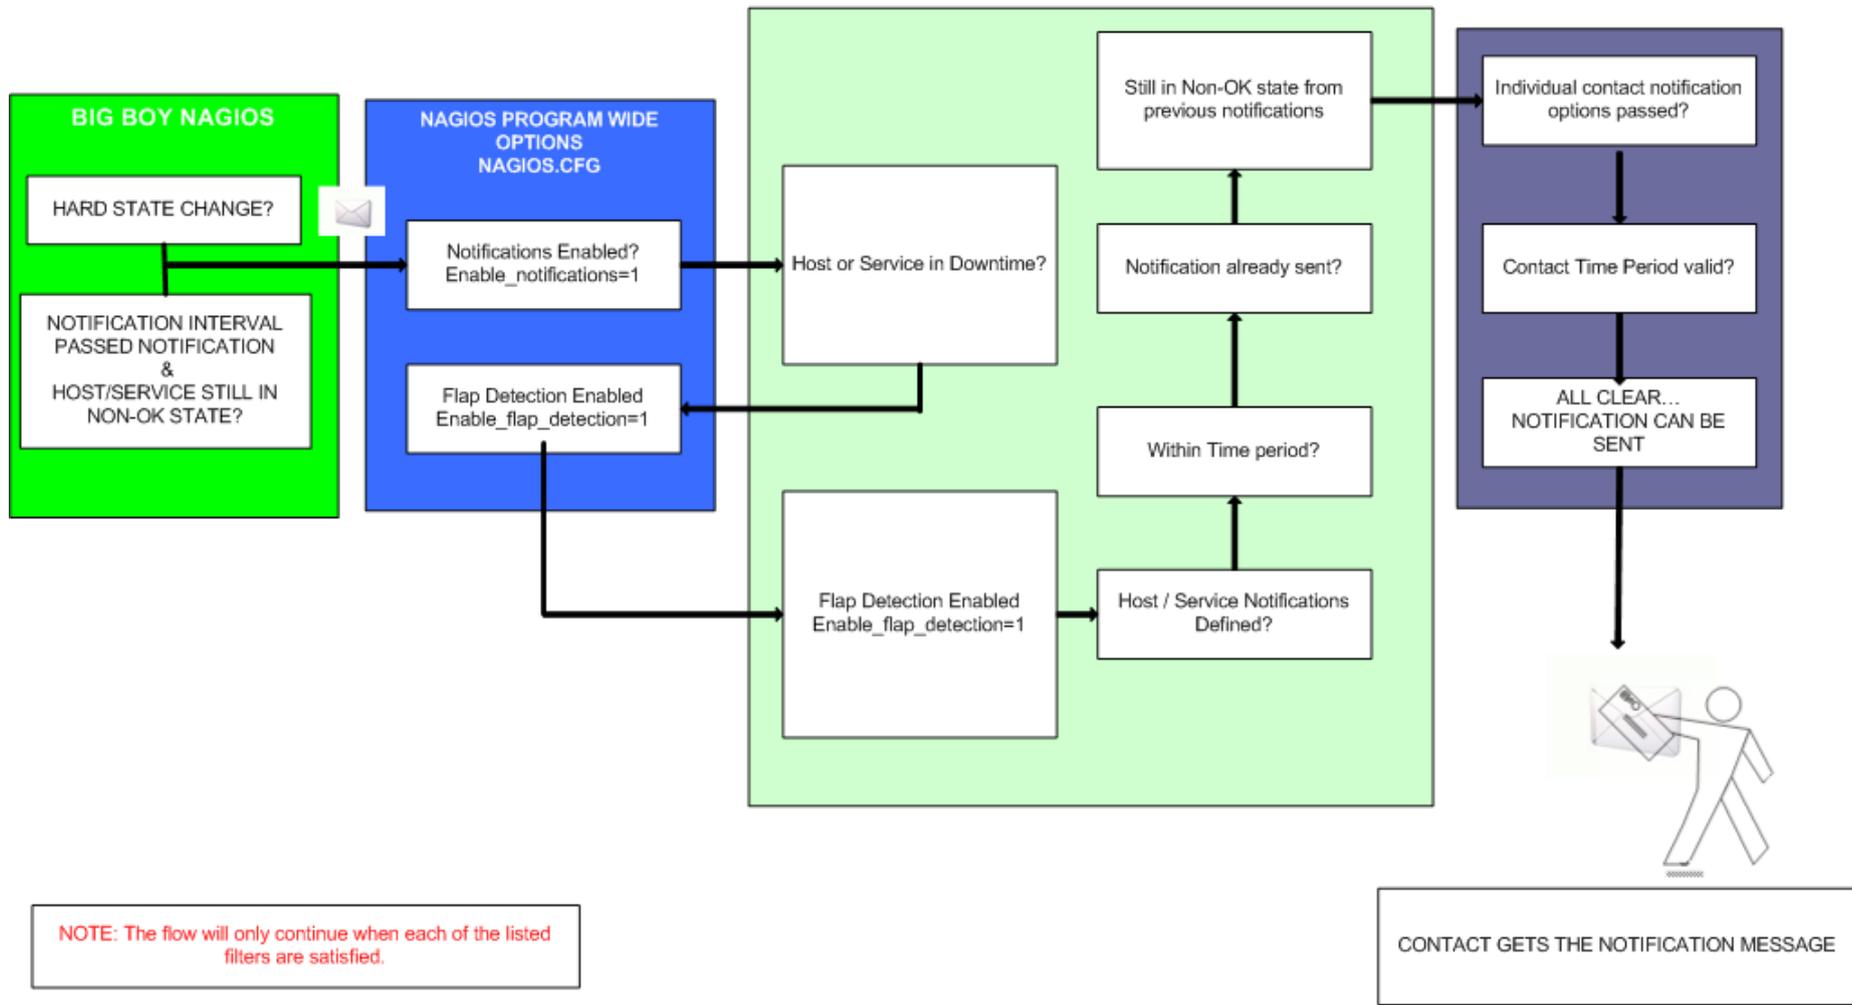

gammu: <http://wammu.eu/>

gnokii: <http://www.gnokii.org/>

sms-tools: <http://smstools3.kekekasvi.com/>

I use a Raspberry Pi with Kannel: <http://www.kannel.org/>

Additional Details

A few additional slides you may find useful or informative...

More Features

- Allows you to acknowledge an event.
 - A user can add comments via the GUI
- You can define maintenance periods
 - By device or a group of devices
- Maintains availability statistics and generates reports
- Can detect flapping and suppress additional notifications.
- Allows for multiple notification methods:
 - e-mail, pager, SMS, winpopup, audio, etc...
- Allows you to define notification levels for escalation

Host Notification Options

Host state:

When configuring a host you can be notified on the following conditions:

- **d**: DOWN
- **u**: UNREACHABLE
- **r**: RECOVERY
- **f**: FLAPPING (start/end)
- **s**: SCHEDULED DOWNTIME (start/end)
- **n**: NONE

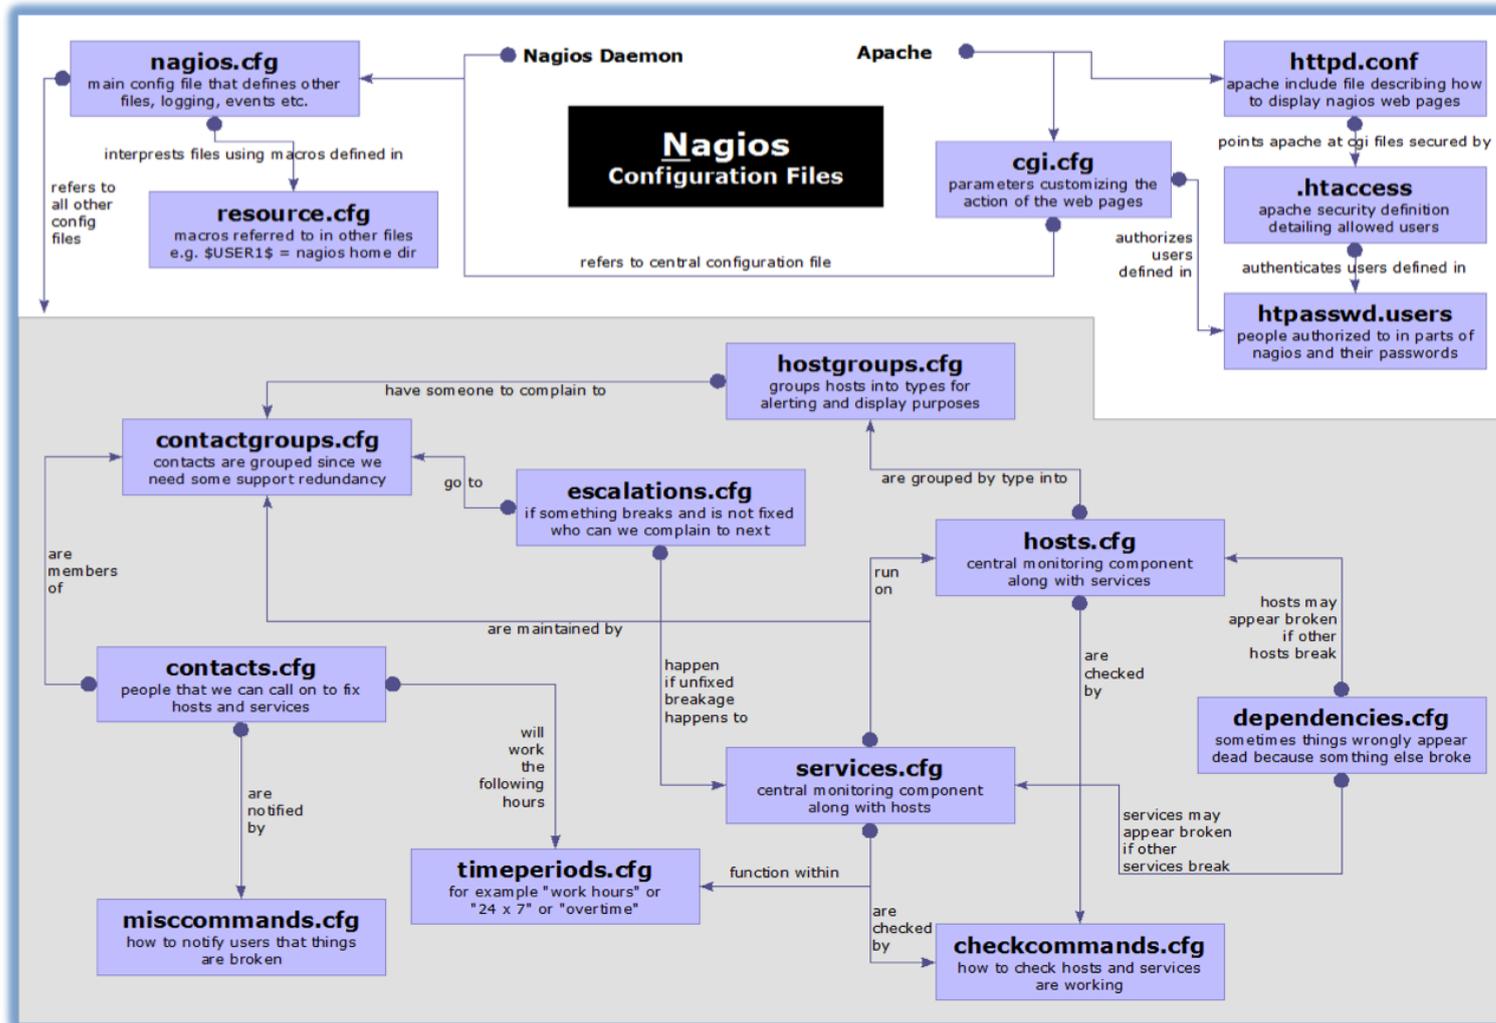

Service Notification Options

Service state:

When configuring a service you can be notified on the following conditions:

- **w**: WARNING
- **c**: CRITICAL
- **u**: UNKNOWN
- **r**: RECOVERY
- **f**: FLAPPING (start/end)
- **s**: SCHEDULED DOWNTIME (start/end)
- **n**: NONE

Configuration Files

Debian/Ubuntu Configuration Files

Located in `/etc/nagios3/`

Important files include:

- `nagios.cfg` Main configuration file.
- `cgi.cfg` Controls the web interface and security options.
- `commands.cfg` The commands that Nagios uses for notifications.
- `conf.d/*` All other configuration goes here!

More Configuration Files

Under conf.d/*

- `contacts_nagios2.cfg` users and groups
- `extinfo_nagios2.cfg` make your UI pretty
- `generic-host_nagios2.cfg` default host template
- `generic-service_nagios2.cfg` default service template
- `host-gateway_nagios3.cfg` upstream router definition
- `hostgroups_nagios2.cfg` groups of nodes
- `localhost_nagios2.cfg` definition of nagios host
- `services_nagios2.cfg` what services to check
- `timeperiods_nagios2.cfg` when to check who to notify

More Configuration Files

Under conf.d some other possible config files:

- [servicegroups.cfg](#) Groups of nodes and services
- [pcs.cfg](#) Sample definition of PCs (hosts)
- [switches.cfg](#) Definitions of switches (hosts)
- [routers.cfg](#) Definitions of routers (hosts)

Main Configuration Details

Global settings

File: `/etc/nagios3/nagios.cfg`

- Says where other configuration files are.
- General Nagios behavior:
 - For large installations you should tune the installation via this file.
 - See: *Tunning Nagios for Maximum Performance*
http://nagios.sourceforge.net/docs/3_0/tuning.html

CGI Configuration

`/etc/nagios3/cgi.cfg`

- You can change the CGI directory if you wish
- Authentication and authorization for Nagios use:
 - Activate authentication via Apache's .htpasswd mechanism, or using RADIUS or LDAP.
 - Users can be assigned rights via the following variables:
 - `authorized_for_system_information`
 - `authorized_for_configuration_information`
 - `authorized_for_system_commands`
 - `authorized_for_all_services`
 - `authorized_for_all_hosts`
 - `authorized_for_all_service_commands`
 - `authorized_for_all_host_commands`

Time Periods

This defines the base periods that control checks, notifications, etc.

- Defaults: 24 x 7
- Adjust as needed, such as work-week only.
- Set up new time period for “outside regular hours”, etc.

```
# '24x7'  
define timeperiod{  
    timeperiod_name 24x7  
    alias            24 Hours A Day, 7 Days A Week  
    sunday           00:00-24:00  
    monday           00:00-24:00  
    tuesday          00:00-24:00  
    wednesday        00:00-24:00  
    thursday         00:00-24:00  
    friday           00:00-24:00  
    saturday         00:00-24:00  
}
```

Configuring Service/Host Checks

```
define command {
    command_name    check_ssh
    command_line    /usr/lib/nagios/plugins/check_ssh '$HOSTADDRESS$'
}
```

```
define command {
    command_name    check_ssh_port
    command_line    /usr/lib/nagios/plugins/check_ssh -p '$ARG1$' '$HOSTADDRESS$'
}
```

[/etc/nagios-plugins/config/ssh.cfg](#)

- Notice the same plugin can be invoked in different ways (“commands”)
- Command and arguments are separated by exclamation marks (!)
- e.g. to check SSH on a non-standard port, you can do it like this:

```
define service {
    hostgroup_name    ssh-servers-2222
    service_description    SSH-2222
    check_command     check_ssh_port!2222
    use               generic-service
}
```

this is
\$ARG1\$

Notification Commands

Use any command you want!

We could use this to generate tickets in RT.

```
# 'notify-by-email' command definition
define command{
    command_name    notify-by-email
    command_line    /usr/bin/printf "%b" "Service: $SERVICEDESC$\nHost:
$HOSTNAME$\nIn: $HOSTALIAS$\nAddress: $HOSTADDRESS$\nState: $SERVICESTATE$\nInfo:
$SERVICEOUTPUT$\nDate: $SHORTDATETIME$" | /bin/mail -s '$NOTIFICATIONTYPE$:
$HOSTNAME$/$SERVICEDESC$ is $SERVICESTATE$' $CONTACTEMAIL$
}
```

```
From: nagios@nms.localdomain
To: router_group@localdomain
Subject: Host DOWN alert for TLD1-RTR!
Date: Thu, 29 Jun 2006 15:13:30 -0700
```

```
Host: gw
In: Core_Routers
State: DOWN
Address: 192.0.2.100
Date/Time: 06-29-2006 15:13:30
Info: CRITICAL - Plugin timed out after 6 seconds
```

Group Service Configuration

```
# check that ssh services are running
define service {
    hostgroup_name      ssh-servers
    service_description SSH
    check_command       check_ssh
    use                  generic-service
    notification_interval 0
}
```

The “service_description” is important if you plan to create Service Groups. Here is a sample Service Group definition:

```
define servicegroup{
    servicegroup_name  Webmail
    alias              web-mta-storage-auth
    members            srvr1,HTTP,srvr1,SMTP,srvr1,POP, \
                    srvr1,IMAP,srvr1,RAID,srvr1,LDAP, \
                    srvr2,HTTP,srvr2,SMTP,srvr2,POP, \
                    srvr2,IMAP,srvr2,RAID,srvr2,LDAP
}
```
